

Scenario:

You are a personal chef, working on finding recipes that suit the family's needs while staying on their budget with their groceries. You are always having difficulty finding recipes, so you would find it very helpful if you had some sort of app to find all your recipes on instead of bouncing around on different websites constantly.

Task 1: Search for steak recipe based on price, find one and add it to favorites list for future reference.

Task 2: Finding a base for greek salad, edit the salad and customize the existing recipe to create your own specialized recipe.

Task 3: You find that a recipe does not contain all the necessary steps or ingredients, then report the recipe as incomplete.

What changes should you make to your application?

- Implement a favorites list
- Implement a report recipes button on the page
- Generate a report form for recipes that violate rules
- Main page should have "recently added" section

What do you need to keep the same for your application?

- Keep the edit recipe feature on recipes page
- The search feature must still contain all the necessary sorting attributes
- Keep the main menu's features including featured recipes and categories
